MODEL 42-350

## PHILCO RADIO &amp; TELEVISION CORP.

## MODEL 42-322 ALIGNMENT

**Signal Generator:** When adjusting the I. F. padders, the high side of the signal generator is connected through a .1 mfd. condenser to the antenna section of the tuning condenser. Connect the ground or low side of the generator to the chassis.

When aligning the R. F. padders a loop is made from a few turns of wire and connected to the signal generator output terminals; the signal generator is then placed close to the loop of the radio.

The receiver can be adjusted in the cabinet or removed from the cabinet. When adjusting the R. F. Compensators in the cabinet, the aligning points on the dial scale are used. If the radio is adjusted outside of the cabinet, the small indentations (lines) on the dial metal background plate mounted on the chassis are used as aligning points. These points progressing from the left end of the scale plate represent frequencies as follows: pointer position with tuning condenser closed, 580 K.C., 9.5 M.C., 1500 K.C., 15 M.C., and the test line 1720 K.C. or 15.5 M.C. When adjusting the radio outside the cabinet the loop aerial should be placed in approximately the same position around or near the chassis as when assembled.

**NOTE A—DIAL POINTER CALIBRATION:** In order to adjust the receiver correctly, the pointer must be adjusted to track properly with the tuning condenser. To do this, turn the tuning condenser to the maximum capacity (plates fully meshed). With the condenser in this position, set the tuning pointer on the first small line stamped in the scale plate on the left side.

**NOTE B—**To accurately adjust the high frequency oscillator compensator to the fundamental instead of the image signal, turn the oscillator compensator (18A) to the maximum capacity position (clockwise). From this position slowly turn the compensator counter-clockwise until a second peak is obtained on the output meter. Adjust the compensator for maximum output at this second peak.

If the above procedure is correctly performed, the image signal will be found (much weaker) by turning the signal generator dial 910 K.C. above the frequency being used on any high frequency range.

The aerial padder (5) must be adjusted to maximum by rolling the tuning condenser. If two signal peaks occur when turning the padder, adjust to maximum output on the first signal peak from the tight position (screw all the way down) of the padder.

## -Model L42-350, Code 121

## EXTERNAL AERIAL CONNECTIONS

The built-in aerial system is designed to operate without an outside aerial or ground lead and to give exceptionally high receiving performance of stations in the standard, shortwave, or FM bands.

To operate the radio in steel reinforced buildings and other shielded locations where signal strength is weak, an external aerial is recommended. Three different types of aerial combinations are available, to improve reception on the standard, short-wave, or FM bands.

## 1—For Additional Sensitivity on Frequency Modulation only:

\*Philco Dipole Outdoor Aerial, Part No. 45-2926.

The plug at the end of the transmission line is inserted in the socket at the back of the chassis in place of the plug connected to the F. M. loop in the cabinet.

## 2—For Additional Sensitivity on ALL ranges:

\*Philco Dipole Outdoor Aerial, Part No. 45-2926.

Philco Aerial Coupler, Part No. 45-1361.

The coupler plugs into the socket at the back of the chassis in place of the plug connected to the F. M. loop. The aerial transmission line then connects to the terminals on the coupler marked "red" and "black." The local-distance switch on the coupler connects or disconnects the outdoor aerial from the standard broadcast and shortwave tuning ranges. The dipole remains connected to the F. M. band regardless of the position of the switch.

## 3—For Additional Sensitivity on Standard Broadcast and Shortwave only in Areas where F. M. reception is not available.

Philco Safety Aerial, Part No. 40-6370.

Philco Aerial Coupler, Part No. 45-1361.

Connect the single wire lead in of the aerial to the "black" terminal on the aerial coupler.

\*Accessories for this aerial are the Philco Aerial Mast Kit, the Philco Reflector Kit and Philco High Efficiency Transmission Line. See Service Bulletin No. 366 on Dipole Aerials.

**NOTE:** When installing the F. M. Philco Outdoor Dipole Aerial, it is very important that the aerial compensating condensers of the standard and shortwave band are repadded.

## ELECTRIC PUSH-BUTTON TUNING ADJUSTMENTS

The electric push-button tuning mechanism consists of six (6) push-buttons. Five of the push-buttons are used for selecting standard broadcast stations, and one for the power control (ON-OFF).

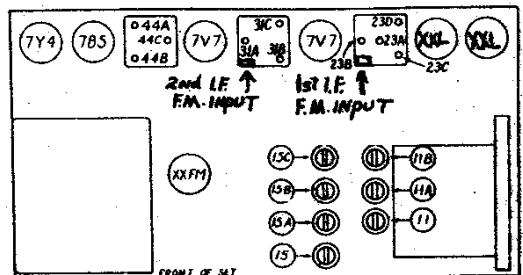

Viewing the front of the cabinet from left to right the first push-button is the power control (ON-OFF), the next five push-buttons for tuning standard broadcast stations.

When setting up stations on the push-buttons the lowest frequency station is set up in the second push-button from the left and the remaining stations according to increasing frequency in the next four push-buttons. These push-buttons are adjusted by the padders located on the rear of the chassis.

The frequency ranges covered by the station tuning push-buttons and procedure for adjusting are as follows:

| Padders (right to left from rear) | Circuit | Buttons (left to right from front) | Frequency Range |
|-----------------------------------|---------|------------------------------------|-----------------|
| 1                                 | Anf.    | 1                                  | ON-OFF          |
| 2                                 | Osc.    | 2                                  | 540 to 980 KC   |
| 3                                 | Anf.    | 3                                  | 540 to 980 KC   |
| 4                                 | Osc.    | 4                                  | 710 to 1185 KC  |
| 5                                 | Anf.    | 5                                  | 850 to 1600 KC  |
| 6                                 | Osc.    | 6                                  | 1185 to 1720 KC |
| 7                                 | Anf.    |                                    |                 |
| 8                                 | Osc.    |                                    |                 |
| 9                                 | Anf.    |                                    |                 |
| 10                                | Osc.    |                                    |                 |

The second push-button from the left can also be adjusted for reception of the sound channel of a television program received by special Philco television radios. This push-button may also be used in conjunction with a Philco Wireless Record Player.

MODEL 42-350

## PHILCO RADIO &amp; TELEVISION CORP.

## CONNECTING ALIGNING INSTRUMENTS

**AUDIO OUTPUT METER:** Terminal No. 3 is provided on the loop aerial panel for connecting one lead of the audio output meter to the voice coil of the speaker. The other lead of the meter is connected to the chassis. When using these connections, the lowest A. C. scale of the meter must be used. (0 to 10 volts.)

The audio output meter can also be connected between the plate of the output tube and the chassis.

**SIGNAL GENERATOR:** When adjusting the "I. F." padders, the high side of the signal generator is connected through a .1 mfd. condenser to the points indicated in signal generator column "output connections" to receiver in the tabulations below.

When aligning the R. F. padders a loop is made from a few turns of wire and connected to the signal generator output terminals; the loop is then placed two or three feet from the loop in the cabinet and dipole aerial lead. Do not remove the receiving loops from the cabinet. It is necessary when adjusting the padders, that the receiver be left in the cabinet.

After connecting the aligning instruments adjust the compensators in the order shown in the tabulation below. Location of the compensators are shown in Fig. 1. If the output meter pointer goes off scale when adjusting the compensators, reduce the strength of the signal from the generator.

## FREQUENCY MODULATION ALIGNING PROCEDURE

Note: The Frequency Modulation Circuits Must Be Adjusted With the Dipole Aerial Connected

## CRITICAL WIRING LOCATIONS

The following items on this set are critical for location and position. See Figs. 4 and 5, for locations of wires and parts.

- Note 1. Dipole aerial leads from socket to be twisted and dressed over wave switch directly to F. M. aerial-oscillator transformer No. 7.
- Ground braid from gang to chassis to be wired and soldered on top side of subbase in such a manner so that there is a floating bond between ground and the condenser.
  - Short wave aerial transformer (No. 9) to be wired directly between terminal panel 4 and band switch contact C-11-C so that there is a minimum of slack in the wires.
  - Wire from broadcast aerial transformer (No. 10) to ground to be dressed under short wave aerial transformer (No. 9).
  - Wire from band switch contact B-11 to compensator 15 to be direct and away from switch and other wires.
  - Red and white wires from 1st I. F. transformer to be dressed on base and not twisted with other wires from same coil. Green wire to be free of other wires and direct to contact 6 of the 7V7, 1st I. F. tube.
  - Wires from 3rd I. F. transformer (44) to be brought out proper holes and not twisted together inside of can.
  - Green and yellow wires of 3rd I. F. transformer 44 to run from hole in subbase between terminal panel 5, contacts 2 and 3 and direct to contacts of the XXFM tube 5 and 6. Orange, blue, black and brown leads to be free of other wires and dressed off base.
  - Condenser (45) to be dressed off base.
  - A.C. switch leads to be twisted.
  - Wire from prong 5 of the 7V4 tube to lug 3 of the loop aerial terminal panel to be dressed between Electrolytic Condenser 76 and Mounting Strap and to rear of chassis across bottom contacts of F. M. socket.
  - White, red and black wires of 1st I. F. transformer to be dressed with excess out of coil shield and towards rear of chassis and close to base. Red lead to be dressed around and under coil leads going to XXFM converter tube socket. Orange, yellow, green and blue leads to be dressed with excess out of coil shield and away from the white, red and black leads.
  - Wire from band switch contact C-12-C to compensator 15-C to be dressed free of other wires.
  - Dress wire from band switch contact B-12 to wiring panel 4, lug 4 with excess toward front of set, under shortwave aerial transformer (9), keeping wire between the terminal panel 4 and wires coming through subbase which connect to F. M. aerial-oscillator transformer (7) and band switch.
  - Keep wires from terminal panel No. 5 contact No. 5 to band switch contact DB and terminal panel No. 6 to terminal panel No. 4 between padder strip and mounting stud of 1st I. F. transformer so that they are kept clear of leads from the 1st I. F. transformer.

## F. M. BAND ALIGNING PROCEDURE

| 5                   | "   | 48.5 MC             | 85           | Band Switch "F.M."           | 15 oscillator                |   |

**NOTE A.—DIAL CALIBRATION:** In order to adjust the receiver correctly, the dial pointer must be aligned to track properly with the tuning condenser. To adjust the dial pointer to track with the tuning condenser when maximum capacity is set, the dial pointer on the extreme left index line at the low frequency end of the broadcast scale.

**NOTE B.—**When adjusting the low frequency compensator of the broadcast range of the receiver, the tuning condenser must be adjusted (Note A) as follows: First turn the tuning compensator for maximum output, then vary the tuning condenser of the receiver for maximum output. Now turn the compensator slightly to the right or left and again vary the receiver tuning condenser for maximum output. This procedure of fine setting the compensator and varying the tuning condenser is continued until maximum output reading is obtained.

**NOTE C.—**Adjust compensator (151) to the second signal peak from the closed position (maximum capacity).

The aerial compensator (11A) must also be adjusted to maximum on the first signal peak by rolling the tuning condenser. (See Note B.)

**NOTE D.—**With the signal generator set to 4.3 MC, padder (44C) is adjusted to the point where minimum signal indication is observed on the output meter.

**NOTE E.—**Turn the signal generator first to approximately 125 KC below 4.3 MC (4.17 MC) and then 125 KC above 4.3 MC (4.48 MC). The signal peak should be observed on the output meter at approximately each of these points (4.17 and 4.48). The two peak signals should be of equal reading on the output meter and equally spaced in frequency. Each of the two peaks should be unequal in amplitude, padder (44A) must be adjusted in the direction necessary to make both peaks equal. This is done by slightly turning padder and then turning the signal generator above and below 4.3 to observe the peaks. After obtaining equality in the output of the signal generator to 4.3 MC, the output meter should show zero reading at 4.3 MC. If a signal indication is observed

readjust padder (44C) until zero reading is obtained on the meter. After this adjustment is made padder No. 44A should be reset for equal peaks as given above.

**NOTE F.—**Adjust padders 31A, 31B, 23C, and 23D for equal signal peaks and equal frequency spacing each side of 4.3 MC.

**NOTE G.—**The dial scale numbers are listed in tenths of megacycles less the first digit; i.e., 49 MC is 90, 49.5 is 85. Set the tuning dial pointer to 90 on the F. M. scale. Adjust padder (15) to the point where minimum signal indication is observed on the output meter.

**NOTE H.—**In order to adjust padder (15C) the signal generator should be set to either the signal peak approximately 125 KC below 49 MC (48.875 MC), or 125 KC above 49 MC (49.125 MC). Adjust padder (15C) to maximum output reading on either of these peak signals. As padder 15C is being adjusted roll the tuning condenser as given in Note B.
